

SUBSTITUTE DRIVER APPLICATION

Team Member: **Tan Jin Zhen** (**Substitute Driver Booking**)
Ng Shao Kang (**User Account Management**)
Tang Jun Pin (**Weather & Safety Alerts**)
Ng Wei Hong (**Vehicle Services**)

PRESENTED TO:
Mr Tan Kee Oon

The Substitute Driver Application is an application that have turn the traditional word-of-mouth and cash-based designated driver into a streamlined app solution through the use of mobile application platform. This application has fulfilled SDG 9 directly through the use of digital innovation and inclusive infrastructure in the traditionally informal industry. Utilizing the data.gov.my website's API for weather information to alert both drivers and passengers about hazardous driving conditions prior to and during the ride.

Development of the application is divided among the four parts owned by the team member:

- **Substitute Driver Booking** – *Find a Driver flow, fare calculation, live GPS tracking, quick commands, share trip status*
- **Weather & Safety Alerts** – *data.gov.my integration, flood/road alerts, safe route suggestion*
- **Vehicle Services** – *Car Service scheduling, status tracker, post-service payment, vehicle details*
- **User Account Management** – *profile, payment methods, activity/chat history, digital receipts & export, settings*

Problem & Solution

03/10

Problem #1

Substitute driving today is fragmented and unsafe

- No standard, transparent pricing – fares are negotiated case-by-case
- Families waiting at home have no visibility into the trip in progress
- Vehicle hand-off for pick-up/drop-off & servicing relies on informal trust

Solution #1

- **Smart Booking & Fare Calculator** – flagfall + per-km pricing, instant transparent quotes
- **Live Trip Tracking** – real-time location shared with passenger & family
- **Vehicle Pick-up/Drop-off & Care** – structured handover for servicing without the owner present

Problem & Solution

04/10

Problem #2

Drivers lack real-time road & weather awareness

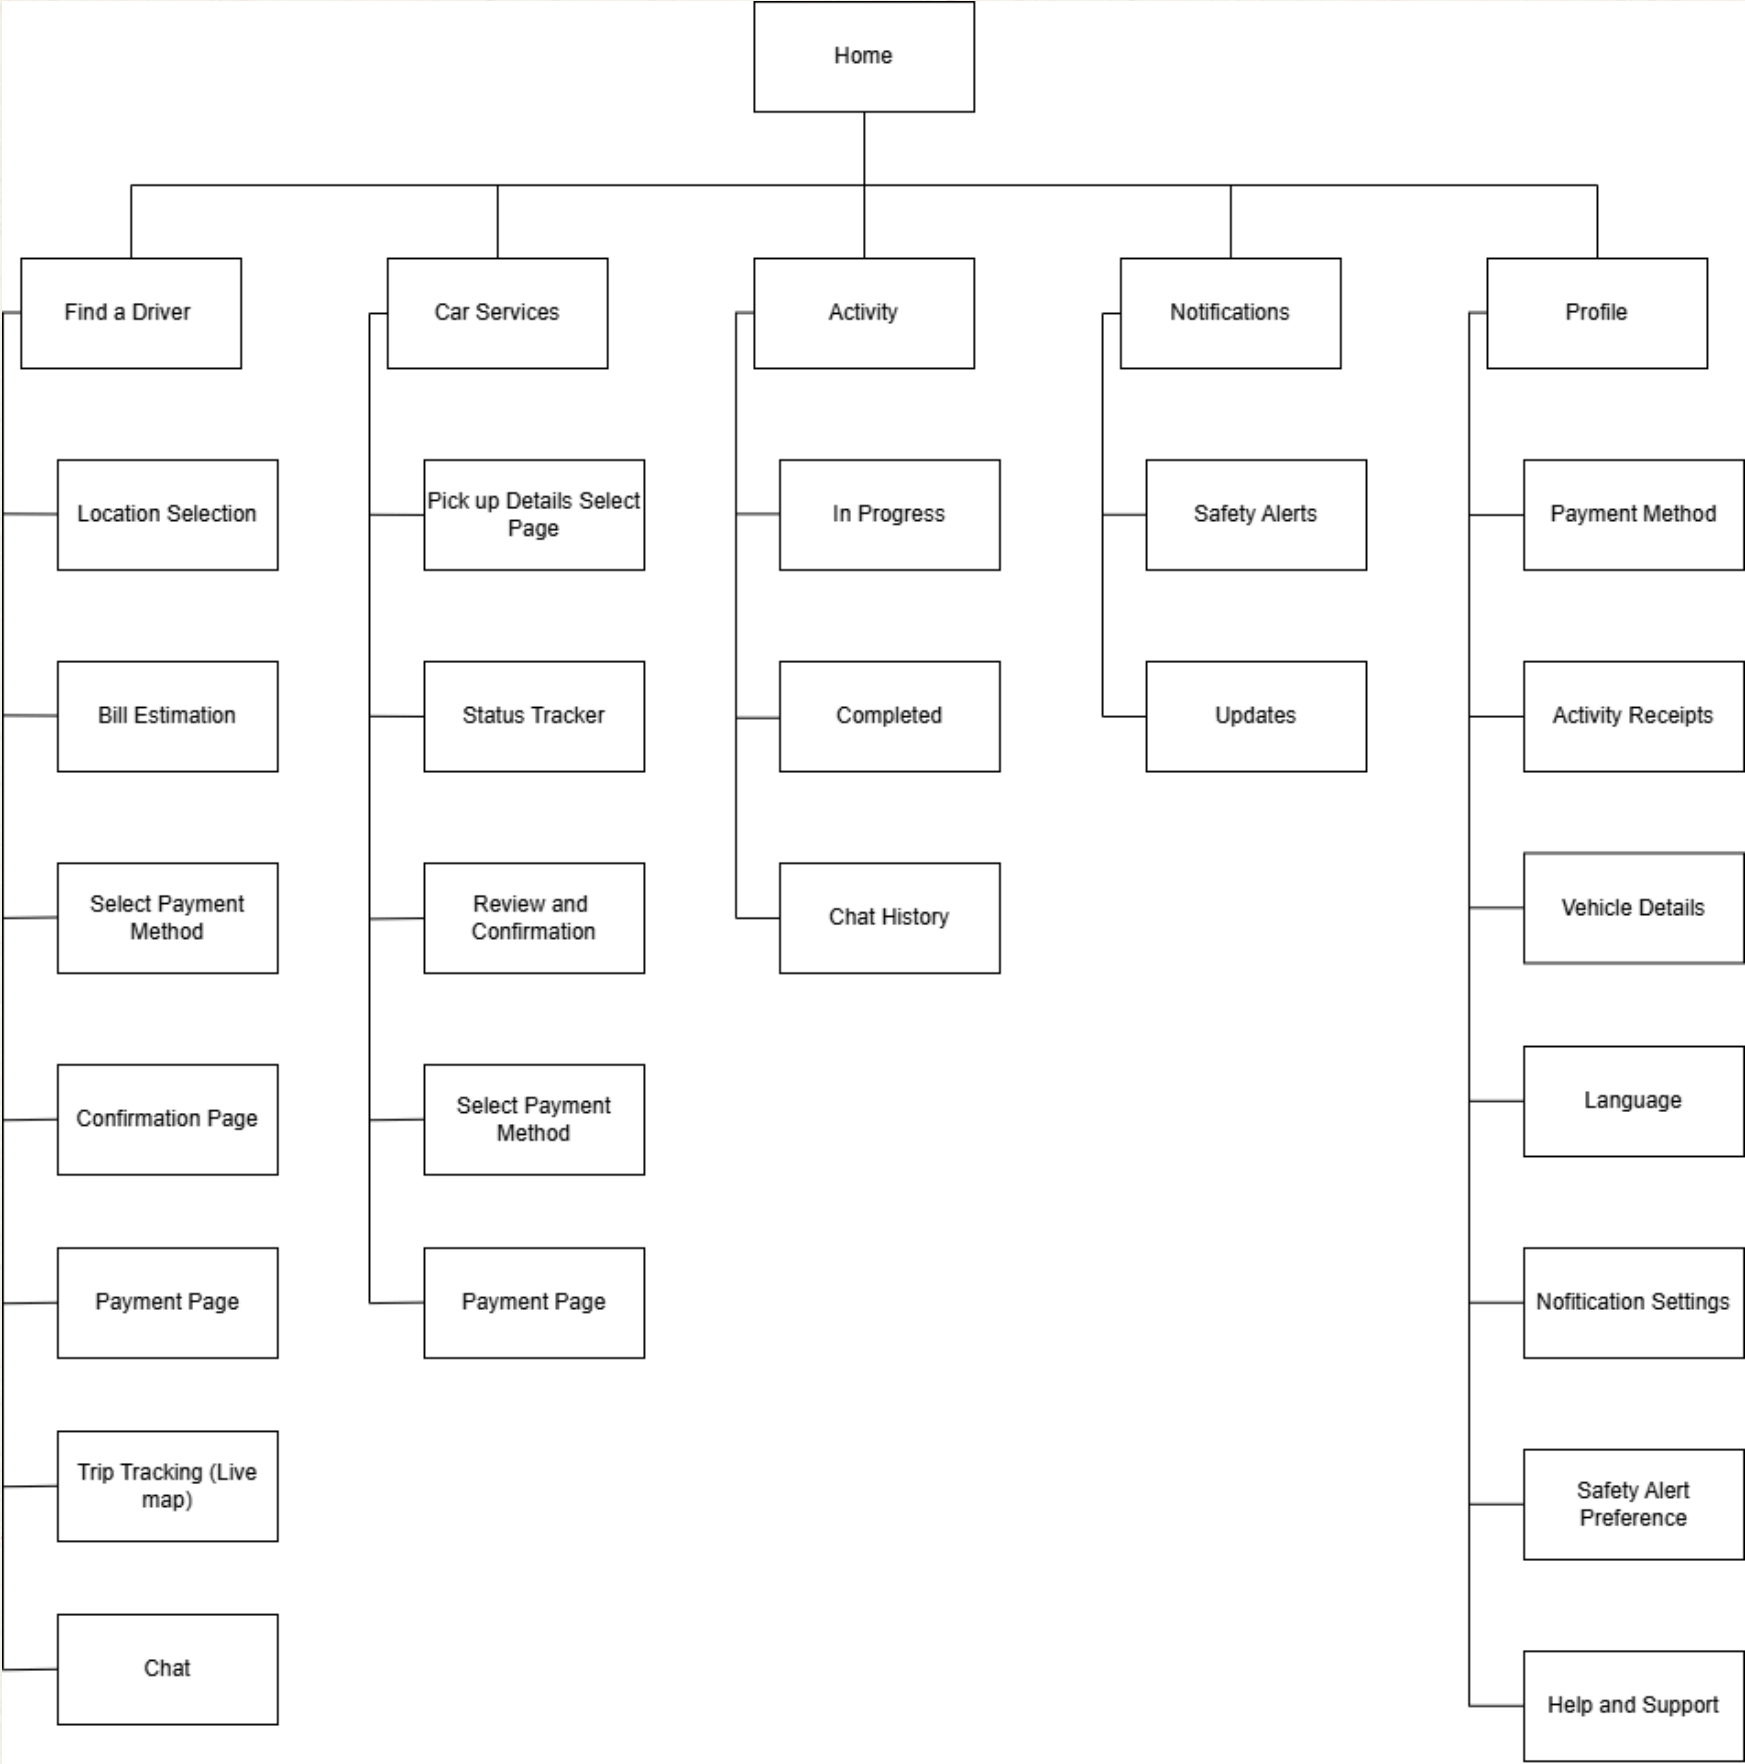

- Sudden heavy rain and flash floods catch drivers unprepared at night
- No early warning for accident-prone stretches or road closures
- Manual rerouting wastes time and increases risk on unfamiliar roads

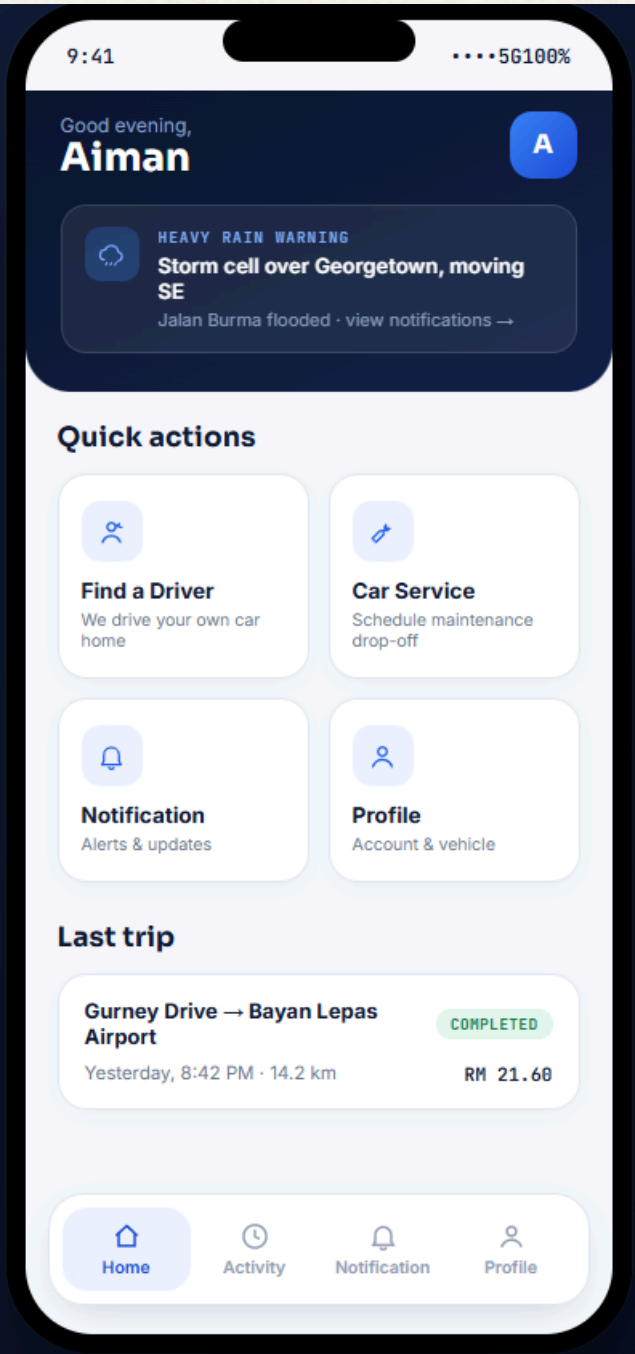

Solution #2

- **Real-Time Weather Alerts** – live feed from data.gov.my warns of unsafe conditions
- **Road Closure & Flood Alerts** – flags hazardous or blocked stretches ahead of time
- **Safe Route Recommendation** – suggests safer alternate roads automatically

Conclusion

The Substitute Driver Application converts an unorganized, loosely regulated industry into a secure and data-driven online platform in direct alignment with SDG 9 and its emphasis on innovation and infrastructure. With the implementation of smart bookings, tracking, and real-time weather safety alerts from data.gov.my, the app have ensure the safety of both the driver and the passenger as well as upgrading an existing substitute-driver service that Malaysians always use. Each of the modules have been designed in the prototype forms and defined ownership role among our team members.
